

ABSTRACT OF THE DISCLOSURE

An electronic card connector with fixed lateral arms, including: a plastic main body in which multiple terminals are inlaid, at least one lateral arm projecting from each side of the main body, the two lateral arms defining therebetween an electronic card receptacle, a stopper block being formed on each lateral arm; and at least two resilient members respectively fitted on outer sides of the lateral arms. Each resilient member has a bent stopper board section projecting from the resilient member. The stopper board section projectively extends to the inner side of the lateral arm and is positioned above the electronic card receptacle.
